Dear Homeowner,

We would like to share an important update regarding your irrigation system and upcoming seasonal watering adjustments.

Your irrigation controller is equipped with a Seasonal Adjustment feature. This feature allows us to increase or decrease all zone run times by a percentage without reprogramming each individual zone. By using this tool, we can adapt irrigation schedules to changing weather conditions while maintaining healthy turf and landscaping.

During cooler or more humid periods, irrigation demand is lower. Seasonal adjustment percentages may be reduced (typically 25%–75%) to prevent overwatering. In warmer, drier months, the adjustment may be increased (100%–150%) to meet plant water needs during higher temperatures and increased evapotranspiration.

In Southwest Florida, weather patterns can shift quickly. Making timely irrigation adjustments is essential to:

- Prevent overwatering and reduce the risk of fungus and turf disease
- Promote strong, healthy root growth
- Conserve water while maintaining landscape quality
- Respond to changes in rainfall, temperature, and humidity

As part of our ongoing service, we will be making seasonal adjustments as needed to keep your turf and plants healthy during these weather transitions. These changes help ensure your irrigation system operates efficiently and responsibly year-round.

We appreciate your cooperation and look forward to continuing to care for your landscape.
